

Quality Estimation

(Predicting Reliability)

High S_j → High F1 ✓

Monotonic correlation

Low S_j → Low F1 ✓

AUROC $\approx$ 0.82 ✓
 $\rho \approx$ 0.39

✓ Effective Quality Estimation

Sample Selection

(Choosing Best Output)

Instance-level signal

same score for all y_i given same x

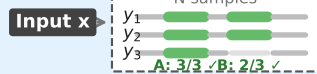

→ Cannot discriminate among samples

best-of-N $\leq$ greedy ✗

✗ Selection Fails

Entity-Level Construction

(Building New Output)

Resolution Entity-level majority vote

Keep entity if freq $\geq \theta$ ($\theta = 2/N$)

Constructs NEW output
