

Correlation-Selection Gap

Resolution

Quality Estimation

(Predicting Reliability)

N samples

High S → High F1 ▲

Low S → Low F1 ▼

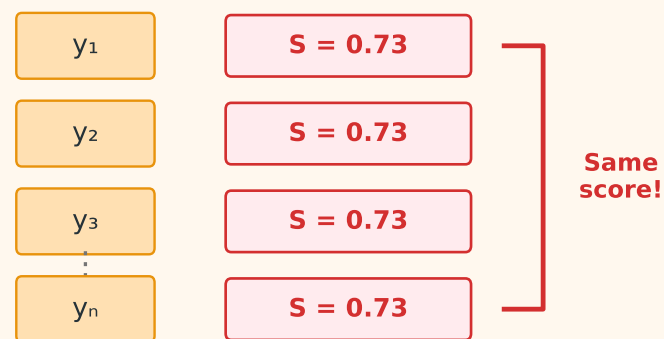

AUROC ≈ 0.82 $p = 0.39$

Effective Quality Estimation

Sample Selection

(Choosing Best Output)

Instance-level signal:

same score for all y_i from same x

Cannot discriminate among samples

best-of- $N \leq$ greedy

Selection Fails

Entity-Level Construction

(Building New Output)

Samples

y1:	PER	LOC	—	ORG
y2:	PER	—	LOC	ORG
y3:	PER	LOC	LOC	—
y4:	PER	—	—	ORG
freq:	4/4	2/4	2/4	3/4

$\theta = 2/N$

Entity-level majority vote

Keep entity if freq $\geq \theta$

Constructs NEW output

+1.4 pp

(Few-NERD, 4-seed)
